

Lab2Q1

IT26102484

M.A.F. AKEELA

The screenshot displays a Windows desktop environment. In the background, a Notepad++ window is open, showing a Java source file named `IT26102484Lab2Q1.java`. The code defines a class `IT26102484Lab2Q1` with a `main` method. It calculates the length and width of a fence based on a given perimeter of 100.0, using the formulas  $length = \frac{perimeter}{3.5}$  and  $width = \frac{perimeter}{4.0}$ . The output is printed to the console.

```
1 public class IT26102484Lab2Q1 {
2     public static void main(String[] args) {
3         // Given perimeter value
4         double perimeter = 100.0;
5
6         // Perimeter = 2 * (length + width)
7         // Since width = (3/4) * length, Perimeter = 2 * (length + 0.75 * length) = 3.5 * length
8         double length = perimeter / 3.5;
9         double width = (3.0 / 4.0) * length;
10
11        // Output the results
12        System.out.println("Length of the fence = " + length);
13        System.out.println("Width of the fence = " + width);
14    }
15 }
```

In the foreground, a Windows Command Prompt window is open, showing the execution of the Java code. The user first attempts to compile the file with `javac IT26102484.java`, which results in an error: `error: file not found: IT26102484.java`. The user then successfully compiles the file with `javac IT26102484Lab2Q1.java`. Finally, the user runs the program with `java IT26102484Lab2Q1`, which produces the following output:

```
C:\Users\user\Desktop\Lab2>javac IT26102484.java
C:\Users\user\Desktop\Lab2>java IT26102484Lab2Q1
Length of the fence = 28.571428571428573
Width of the fence = 21.42857142857143
C:\Users\user\Desktop\Lab2>
```

The Windows taskbar at the bottom shows the system clock as 7:53 AM on 10/2/2026, and the weather as 78°F, Mostly clear.
